

The chosen Software Process Model: **the Waterfall Model**. The reasons for our choice:

1. It is simple and easy to understand/utilize in comparison to other models.
2. The final project is relatively simple and small.
3. The requirements for the final project are clearly defined and are unlikely to change during the project.
4. The only people responsible for setting requirements are 4 team members who have reached an agreement.
5. The work plan developed by the team implies straightforward linear project development.
 - The only adjustment made is to allow the implementation phase to start while the modelling stage is not over. The reason is the limited time.
6. The team members are familiar with the technologies used in the project.
